

AI HR Candidate Screener — LMS Submission

Project Name: Candidate Screener Workspace

GitHub Repository: [shaikshahid777/ai-hr-candidate-screener](https://github.com/shaikshahid777/ai-hr-candidate-screener)

Loom Demo: <https://www.loom.com/share/12321feeaa3540c29236be66419707da>

ChatGPT Project Share: <https://chatgpt.com/share/6aba60f3-4c60-83ee-9a8b-47840f597c9a>

Project Overview

An AI-powered candidate screening workspace that matches uploaded resumes against job descriptions and applies six predefined screening decision rules. The project is configured for structured, factual, bias-aware evaluation without external candidate research or invented qualifications.

Implemented Decision Rules

Rule 1	Missing Info	Missing email or phone → BORDERLINE; request contact details.
Rule 2	Weak Data	2+ year experience shortfall + no relevant certification → WEAK; archive.
Rule 3	Certifications vs Experience	No experience + 3+ relevant certifications → BORDERLINE; 15-minute technical screening call.
Rule 4	Multiple Options	Multiple position matches → strongest skill match + alternative fits.
Rule 5	Unclear Tasks	Vague bullets lacking metrics → BORDERLINE; generate behavioral questions.
Rule 6	Strong Match	All must-haves + 80%+ nice-to-haves → STRONG; configured fast-track action.

Validation Completed

All six rule scenarios were tested: Strong Match (Rule 6), Weak Data (Rule 2), Certifications vs Experience (Rule 3), Multiple Options (Rule 4), Unclear Tasks (Rule 5), and Missing Contact Information (Rule 1). Test outputs were reviewed for correct classification, rule citation, factuality, and required four-part output structure.

Bias & Factuality Controls

The screener is configured not to use age, gender, location, or other protected characteristics in classification. It is also configured to avoid hallucinating qualifications, avoid external candidate searches, and keep screening outputs grounded in uploaded source documents.

Challenges, Resolutions & Limitations

Challenge: Some test cases initially did not isolate the intended rule because the candidate also matched another rule. **Resolution:** Dedicated test resumes were created to isolate each decision scenario and verify the intended rule. **Assumption:** The uploaded job description and candidate documents are the authoritative inputs for screening. **Limitation:** The screener evaluates only information available in the uploaded documents and does not independently verify candidate claims.

Submission Description

Completed the AI HR Candidate Screener capstone by creating a Candidate Screener Workspace with a structured screening configuration, uploaded job descriptions and candidate resumes, and six rule-based decision scenarios. I tested Strong, Weak, and Borderline cases, including missing contact information, experience shortfall, certifications without experience, multiple-position matching, unclear resume tasks, and strong must-have/nice-to-have matching. The main challenge was ensuring each test isolated the intended decision rule; I resolved this by creating dedicated test resumes and open-position documents. The project also includes bias-prevention and factuality controls and uses a four-part structured screening output. The Loom video demonstrates the project setup and validation results.
